

## **Reflective Journal – Module 02 Lab**

**In this lab, I learned how to use basic machine learning tools inside Google Colab and how important it is to explore data before doing anything else. Working with the Iris dataset helped me understand how features relate to each other, and the visualizations made the patterns much clearer. The scatter plot showed how well petal length and petal width separate the species, and the bar chart confirmed the balanced class distribution. Seeing these patterns visually made the dataset easier to understand than just looking at raw numbers.**

**I also learned the value of documenting each step of the process. Writing observations and reflections helped me think about why certain features matter and how they affect model performance. This lab showed me that good documentation is part of the machine learning workflow, not something you do at the end. Using Colab made the process smoother, and it reminded me why cloud notebooks are useful when local files get lost or corrupted.**

**Overall, this lab helped me understand the early stages of the ML lifecycle: loading data, exploring it, visualizing it, and keeping clear notes. These steps make the rest of the machine learning process more reliable and easier to manage.**
